Ajaia: Project Workspace Initiative **Document ID:** SYS-DOC-001 **Classification:** Internal Draft **Status:** High Priority ## 1. Core Objective Ajaia is exploring next-generation internal productivity tools designed to accelerate team collaboration on shared technical work. Our primary mandate is to move beyond legacy document editors and build a lightweight, AI-native collaborative workspace that emphasizes speed, semantic search, and data density. ## 2. Strategic Constraints To maintain high performance and low latency, the engineering team must adhere to the following constraints during the build phase: * Focus on depth in core features over shallow coverage of many features. * Avoid scope creep; do not attempt full feature parity with legacy enterprise monoliths. * Maintain a strict, functional system-terminal aesthetic to maximize information density. ## 3. Implementation Priorities The current engineering sprint focuses on the following technical milestones: 1. Robust file ingestion (parsing strictly .txt and .md payloads client-side). 2. Secure document state management and basic access distribution. 3. Client-side rich text manipulation (bold, headings, structural lists). 4. Neural engine integration for automated semantic document summaries and tagging. ## 4. Technical Stack Notes The frontend infrastructure relies on React and modern CSS paradigms. State management for document buffers must be optimized to prevent memory leaks during large payload injections. *End of Briefing*
